PROJECT SNAPSHOT

CareNavigatorPH helps people describe symptoms safely, understand the appropriate level of care, find verified hospitals with relevant services and availability, and begin a consultation without presenting AI guidance as a medical diagnosis.

1. Community Problem & SDG Alignment

PROBLEM STATEMENT

People in many Philippine communities struggle to decide where to seek care because hospital information is fragmented, service availability is unclear, and symptoms can be difficult to interpret. This can cause delayed treatment, unnecessary travel, crowded facilities, and confusion during urgent situations.

Why this matters in the community

- Patients may not know which nearby facility has the right department, specialist, emergency capability, beds, or rooms.
- Rural residents, older adults, caregivers, and first-time patients may spend extra time calling or visiting multiple facilities.
- Online health information can be misleading when it lacks local context, safety warnings, and a clear path to professional care.

Selected UN Sustainable Development Goal

SDG 3

GOOD HEALTH AND WELL-BEING

Ensure healthy lives and promote well-being for all at all ages.

Direct alignment: Target 3.8 focuses on access to quality essential healthcare services. CareNavigatorPH improves access by connecting users to appropriate, verified, and locally available care.

Intended impact

The app aims to shorten the path from uncertainty to appropriate professional care. It supports informed decisions and timely referrals while keeping emergency escalation, privacy, and clinician review central to the experience.

2. Project Proposal

Core concept

CareNavigatorPH is a mobile healthcare navigation platform designed for Philippine communities. A user can describe symptoms, receive preliminary guidance about urgency and the type of care to seek, compare verified hospitals, and start a consultation. The app does not diagnose or replace a licensed healthcare professional.

Target audience

PRIMARY USERS

- Patients and caregivers
- Residents searching for nearby care
- People unsure which department or hospital level they need

SECONDARY USERS

- Doctors and hospital staff
- Hospital administrators
- Community health workers and referral partners

Primary functionality

01	AI symptom navigator	Collects symptoms and context, then suggests urgency and an appropriate care type with safety warnings.
02	Hospital directory	Searches verified facilities by location, level, service, specialist, and availability.
03	Care matching	Connects assessment needs to suitable hospitals and departments.
04	Consultation request	Lets a first-time user submit care needs and receive a trackable reference.

Scope and safety boundaries

The first version focuses on discovery, preliminary guidance, referrals, and consultation intake. It directs emergencies to 911 or the nearest emergency room, labels AI output as non-diagnostic, protects health data, and requires professional review for clinical decisions.

3. Mockup / Wireframe

User flow: Sign in > describe symptoms > review guidance > find matching care

Patient accounts are created or approved by authorized doctors. Hospital administrators create doctor accounts.

AI symptom navigator

Describe what you are experiencing. CareNavigator will suggest urgency and the type of care to seek—it will not diagnose or prescribe.

*** Do not wait for this tool during an emergency. Call 911 or go to the nearest emergency room now.**

Check symptoms

Home Hospitals Consult My care

SCREEN 1 - SIGN IN

Purpose: Provides secure entry for patients and care providers.

Key elements: Email, password, recovery, and sign-in action.

Next action: Sign in and proceed to the symptom navigator.

SCREEN 2 - SYMPTOM ASSESSMENT

Purpose: Collects information for preliminary care guidance.

Key elements: Symptoms, duration, age, conditions, allergies, medicines, and emergency warning.

Next action: Tap Check symptoms.

Design notes

The interface uses a calm blue-and-teal palette, plain-language instructions, high-contrast actions, and persistent mobile navigation. Emergency messaging appears before the assessment to prevent unsafe reliance on the tool.

SCREEN 3 - CARE GUIDANCE

Purpose: Turns the assessment into a clear next step without diagnosing.

Key elements: Department, warning signs, possible conditions, hospital-level guidance, and disclaimer.

Next action: Tap Find matching hospitals.

SCREEN 4 - HOSPITAL DIRECTORY

Purpose: Compares verified facilities for the identified need.

Key elements: Search, level and ER filters, location, beds, rooms, and details.

Next action: Open a hospital or proceed to consultation.

Flow logic

1
SIGN IN

2
ASSESS

3
GUIDANCE

4
FIND CARE

Expected result

At the end of the flow, the user understands the suggested level of care and has a practical next step: view a suitable hospital, get directions, or begin a consultation. The design reduces uncertainty without removing professional judgment.
